

PROFESSIONAL SUMMARY

Highly analytical Independent Researcher and Developer specializing in low-level computing architectures and binary data manipulation. Experienced in designing custom logic systems, bitwise translation models, and hardware emulators using vanilla JavaScript. Proven ability to deeply analyze file structures and translate complex, handwritten abstract models into functional software solutions.

TECHNICAL SKILLS

- * Programming Languages: JavaScript (ES6+), HTML5, CSS3
- * Core Competencies: Low-Level Binary Analysis, Bitwise Operations, Reverse Engineering, State Machine Design, Data Decryption Algorithms
- * Tools & Methodologies: HTML5 Canvas API, Git, GitHub, Technical Documentation, Visual System Modeling

PROJECTS

DNA Computer & ATGCU CPU Emulator | Independent Research & Development

- * Designed and implemented a custom bio-computing architecture emulator using vanilla JavaScript and HTML5 Canvas.
- * Modeled a low-level 27-chromosome state machine and an ATGCU nucleotide-based CPU register model.
- * Developed a bitwise transition algorithm (documented in 'manual.pdf') capable of parsing binary streams and decoding payloads directly from JPEG image structures.
- * Built an interactive integrated development environment (IDE) with a custom CLI terminal for real-time instruction execution.

RESEARCH & EDUCATION

Independent Researcher in Bio-Computing & Cryptography | 2024 – Present

- * Dedicated to full-time independent research, focusing on non-traditional computing architectures, binary optimization, and low-level data extraction.
- * Developed comprehensive technical documentation and system schematics, demonstrating strong analytical thinking and long-term project dedication.
